PC Specs - (RIP Station)

- **Windows XP Professional 32bit :**
***Windows Vista or 7 (Pro or Ultimate edition **ONLY**, NOT Home version) can be substituted at the expense of increasing the systems specs due to its higher system overhead. Compatibility issues should be minimal due to how long the Vista iteration has been in circulation.*

***Windows XP 32 bit typically only recognizes 2.5 – 2.95GB regardless of the theoretical 4GB maximum. If more RAM is desired, Vista 64 bit should be used as opposed to XP 64 bit. This is due to various compatibility issues resolved in the newest 64 bit iteration of Windows.*
- **4 – 8 GB of RAM :**
*** RAM is a key component in computing performance. 4GB should be the minimum. If more is desired a 64 bit operating system is required.*
- **Intel Core 2 Quad or Quad core Xeon :**
*** 1066 mhz or higher FSB. The faster the clock speed for either of these versions is best. Xeon's are more expensive due to their ability to function optimally for long periods of time under load.*
- **(2) SCSI or SATA Hard Drives:**
***For optimum functionality, RIP files should be stored on a hard drive separate from the operating system and RIP software.*
- **10/100/1000 Network Interface Card (NIC):**
***Can be on-board (Motherboard) or PCI based. A minimum of two should be available to allow for network connectivity in conjunction with a dedicated printer connection.*
- **PCI-E Graphics Card:**
***Not required unless onboard video is not available. Can be ATI or Nvidia but have at least 512MB of onboard RAM.*
- **Internal SATA CD/DVD Burner:**
***At least one (1) is required but two (2) are suggested.*
- **Minimum of four (4) USB ports**
